

PLEXI:

For a Plexi fabrication, the image is printed onto photo paper then laminated to plexi so that the face of the image is behind a sheet of plexi. The back of the image is laminated to a sheet of Sintra; a lightweight/ heavy duty plastic, sealing and protecting the print. On the back of the sintra, a wooden frame is glued, the one below has reinforcements.

The wood frame is constructed to accommodate installation using a French cleat. Once installed the image appears to float on the wall. These prints are luminescent and will last a lifetime.

On the right below is a large plexi image- metallic photo-paper laminated on plexi – that has been installed in Kaiser Permanente, Vista CA. The second image is an 11 panel tree installation in the lobby of a residential high-rise.

Please ask about what's new. **Recently Added: Circles and Round Panel Plexi prints!
